

Figure 1. Cover crop biomass at various termination times

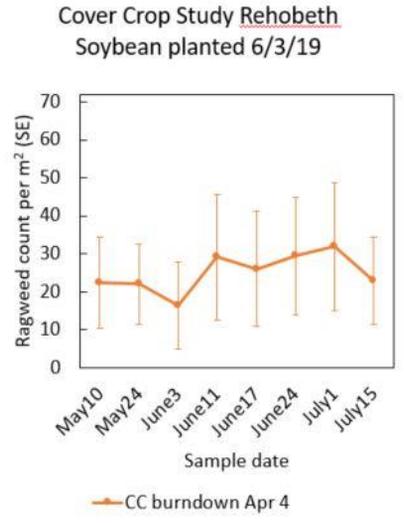

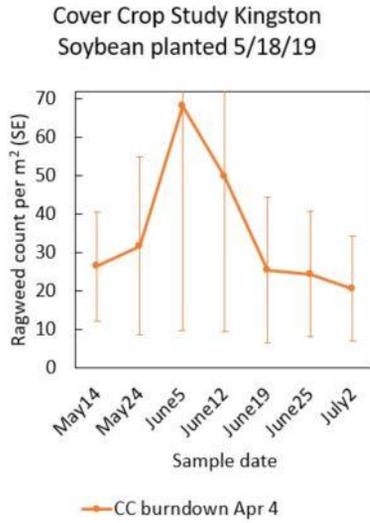

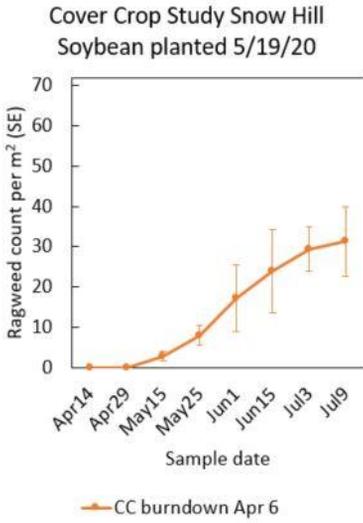

Figure 2. Ragweed populations when no herbicide was used after early April

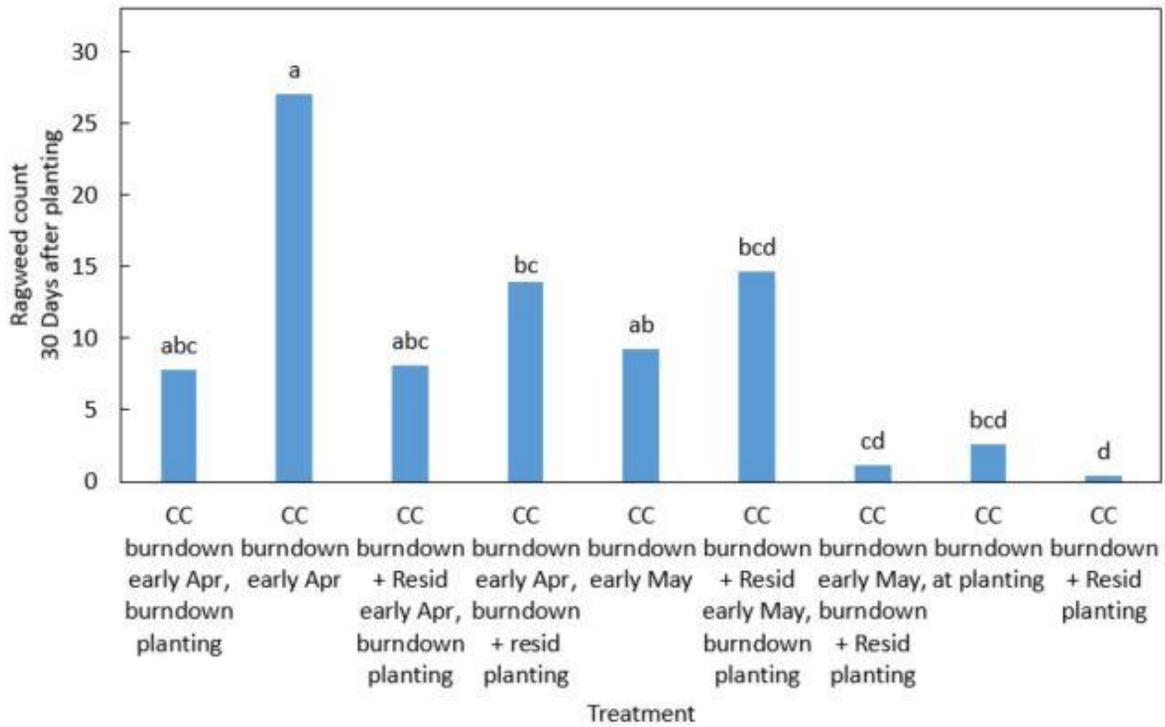

Figure 3. Ragweed count 30 days after soybean planting. Data is the average of Kingston, Rehobeth, and Snow Hill site-years. Different letters indicate statistically significant different ( $p < 0.1$ ) for data with a transformation of  $\ln(0.1+\text{count})$ .

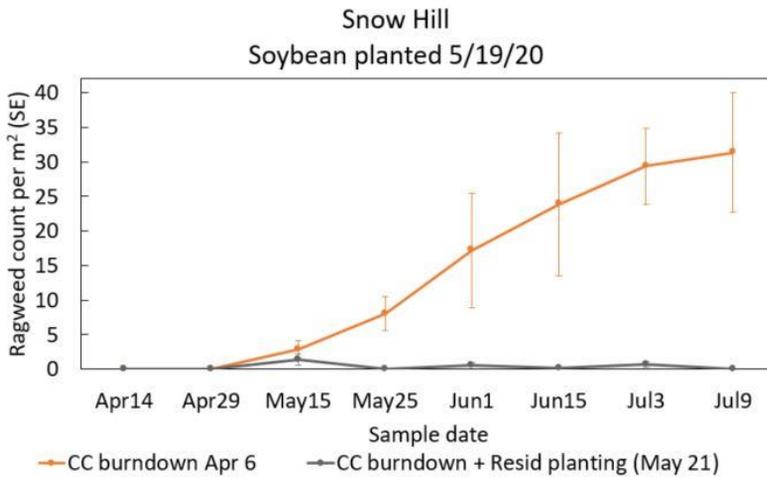

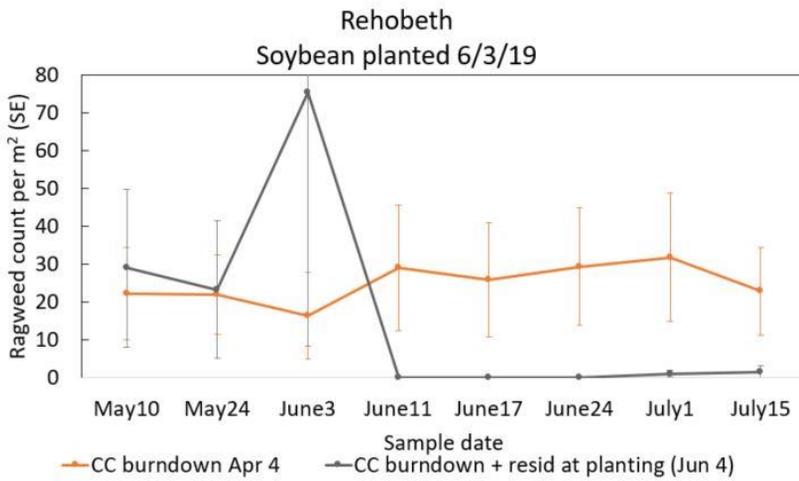

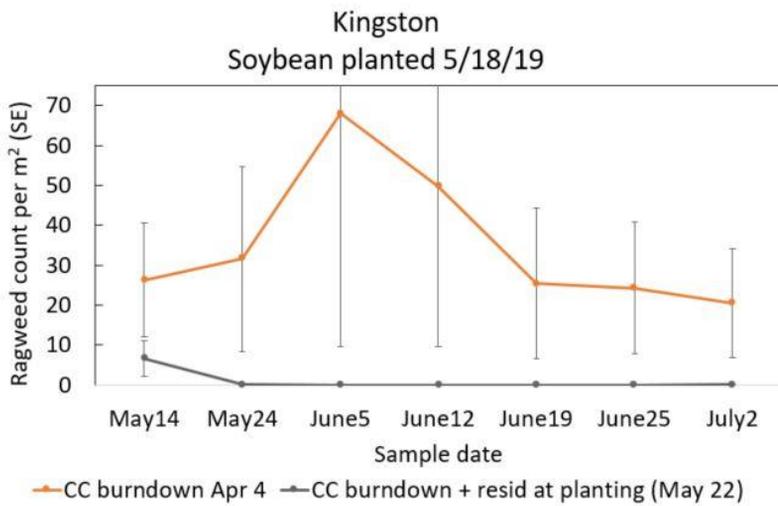

Figure 4. Ragweed count for cover crop termination at planting with a residual herbicide versus control (cover crop termination in early April)
